

Does the reward cutoff change intrinsic diversity?

SCENT sEH surrogate — 2,500 molecules scored at every cutoff, 3 draws each

Generated sample (30k trajectories) Enumerated library (200 hubs)

Dotted verticals: the reward bars the campaign reports at (5 / 6 / 7). Every point scored on the SAME 2,500 randomly drawn molecules (band = SD over 3 draws), so mode and scaffold counts are not confounded by how many molecules survive the cutoff.
